Jim Stankewicz

Introduction

$p \nmid DN$

$p \mid N$

$p \mid D$

Rational Points

Let  $N$  be a positive integer and  $k$  be a field. Define  $Y_0(N)$  so that

$$Y_0(N)(k) = \{(\phi : E_1 \rightarrow E_2)_{/k}\}$$

where  $E_1, E_2$  are elliptic curves over  $k$  and  $\ker \phi$  is cyclic of order  $N$ .

By  $X_0(N)$  we denote the natural compactification of  $Y_0(N)$ .

If  $B_D$  is a quaternion algebra over  $\mathbb{Q}$  of discriminant  $D$ ,  $X_0^D(N)$  is the Shimura curve analogue of  $X_0(N)$ .

# Why Shimura curves?

Rational Points  
on Varieties

Jim Stankewicz

Introduction

$p \nmid DN$

$p|N$

$p|D$

Rational Points

- Useful for studying Elliptic curves and abelian varieties
- Modular forms for  $\Gamma_0(N)$  are given by the cohomology of  $Y_0(N)_{\mathbb{C}}$
- Level-raising and level-lowering is given by the interplay between  $X_0^D(N)$  and  $X_0(DN)$ .

# Atkin-Lehner Involutions

Rational Points  
on Varieties

Jim Stankewicz

Introduction

$p \nmid DN$

$p \mid N$

$p \mid D$

Rational Points

$X_0^D(N)$  comes furnished with a group of automorphisms  $W = \{w_m : m \mid DN\}$  called the Atkin-Lehner group. If  $m \neq 1$ , that is  $w_m \neq \text{id}$ , then  $w_m$  is of order two and is called an Atkin-Lehner involution.

For simplicity, we talk only about the *main* Atkin-Lehner involution  $w_{DN}$ . Note that if  $D = 1$  then on  $X_0^1(N) = X_0(N)$  this simply takes an isogeny  $\phi : E_1 \rightarrow E_2$  to the dual isogeny  $\hat{\phi} : E_2 \rightarrow E_1$ .

# The Big Question

Rational Points  
on Varieties

Jim Stankewicz

Introduction

$p \nmid DN$

$p \mid N$

$p \mid D$

Rational Points

Work of Shimura shows that  $X_0^D(N)_\mathbb{C}$  can be given the structure of a smooth variety over  $\mathbb{Q}$ . He also showed that  $X_0^D(N)(\mathbb{Q}) \neq \emptyset$  if and only if  $D = 1$ .

Question: Are there any *other* ways to give  $X_0^D(N)_\mathbb{C}$  a  $\mathbb{Q}$  structure? Any for which there are  $\mathbb{Q}$ -rational points? For which there are *many* rational points?

Work of Shimura shows that  $X_0^D(N)_\mathbb{C}$  can be given the structure of a smooth variety over  $\mathbb{Q}$ . He also showed that  $X_0^D(N)(\mathbb{Q}) \neq \emptyset$  if and only if  $D = 1$ .

Question: Are there any *other* ways to give  $X_0^D(N)_\mathbb{C}$  a  $\mathbb{Q}$  structure? Any for which there are  $\mathbb{Q}$ -rational points? For which there are *many* rational points?

Equivalent Question: Are there any twists of  $X_0^D(N)_{/\mathbb{Q}}$  which have rational points? Many rational points?

# Why Atkin-Lehner twists?

Rational Points  
on Varieties

Jim Stankewicz

Introduction

$p \nmid DN$

$p \mid N$

$p \mid D$

Rational Points

- Conjecturally,  $W = \text{Aut}(X_0^D(N))$  for all but finitely many  $(D, N)$
- Atkin-Lehner twists over  $\mathbb{Q}$  parametrize abelian varieties over quadratic fields whose Galois representations descend down to  $\mathbb{Q}$
- There is a connection between rational points on Atkin-Lehner twists and the inverse Galois problem
- The action of Atkin-Lehner on “superspecial points” in positive characteristic can be understood in terms of quaternion arithmetic.

First step: Use Hensel’s Lemma along with the action on superspecial points to understand  $p$ -adic points.

If  $p \nmid DN$

Rational Points  
on Varieties

Jim Stankewicz

Introduction

$p \nmid DN$

$p \mid N$

$p \mid D$

Rational Points

Let  $C^D(N, d)$  denote the twist of  $X_0^D(N)$  by  $\mathbb{Q}(\sqrt{d})$  and  $w_{DN}$  and suppose that no prime ramified in  $\mathbb{Q}(\sqrt{d})$  divides  $DN$ .

### Theorem (S-)

*If  $p$  is inert in  $\mathbb{Q}(\sqrt{d})$ ,  $C^D(N, d)(\mathbb{Q}_p)$  is nonempty. If  $p \neq 2$  is ramified,  $C^D(N, d)(\mathbb{Q}_p)$  is nonempty if and only if  $p$  has a degree one factor in  $\mathbb{Q}(j(\sqrt{-DN}))$  or  $\mathbb{Q}\left(j\left(\frac{1+\sqrt{-DN}}{2}\right)\right)$ .*

## Theorem (S-)

*If  $p|N$  is inert in  $\mathbb{Q}(\sqrt{d})$  then  $C^D(N, d)(\mathbb{Q}_p) \neq \emptyset$  if and only if one of the following holds:*

- $p = 2$ , for all  $q|D$ ,  $q \equiv 3 \pmod{4}$ , for all  $q|(N/2)$ ,  $q \equiv 1 \pmod{4}$
- $p \equiv 3 \pmod{4}$ ,  $D = 1$ ,  $N = p$  or  $2p$

$$X_0(39)_{\overline{\mathbb{F}}_3}$$

Rational Points

## Corollary

*If  $\left(\frac{-14}{p}\right) = -1$  then  $C^1(14, p^*)(\mathbb{Q}_v)$  is nonempty for all places  $v$  of  $\mathbb{Q}$  if and only if  $\left(\frac{2}{p}\right) = 1$ ,  $\left(\frac{-7}{p}\right) = -1$*

## Corollary (Depends on the parity conjecture)

*If  $p \equiv 17, 33, 41 \pmod{56}$ ,  $C^1(14, p)$  is a rank one elliptic curve.*
